

Coronavirus Sentiment Analysis Project

DSS Spring 2020

Abstract:

This study presents a comprehensive analysis of sentiment on Asian's all over the world. The social sentiment was conducted on tweets gathered from twitter during COVID-19's peak in April of 2020. The focus of this research is to shed light on the negative social impact that COVID-19 has had on Asians. The aim is to prove that negative sentiment exists, and to further educate people on the issue.

Our Motivation

As COVID-19 continues in its destructive path all across the world, it continues to leave no aspect of life untampered. However, racism was not a typical byproduct of a virus. As the rhetoric against Asians has become more hostile from American politicians, the FBI now warns of potential surge in hate crimes against Asian Americans.

Sentiment Analysis of Social Media Towards Asian Ethnic Groups

Methods

1. Cleaning datasets
2. Computing polarity of cleaned text
3. Create distribution plots and other visual aid for better understanding of data
4. Conduct further analysis

Using Twitter's API

```
def search_for_hashtags(consumer_key, consumer_secret, access_token, access_token_secret, hashtag_phrase):

    #create authentication for accessing Twitter
    auth = tweepy.OAuthHandler(consumer_key, consumer_secret)
    auth.set_access_token(access_token, access_token_secret)

    #initialize Tweepy API
    api = tweepy.API(auth)

    #get the name of the spreadsheet we will write to
    fname = '_'.join(re.findall(r"#(\w+)", hashtag_phrase))

    #open the spreadsheet we will write to
    with open('hashtag%s.csv' % (fname), 'w', encoding='utf-8') as file:

        w = csv.writer(file)

        #write header row to spreadsheet
        w.writerow(['timestamp', 'tweet_text', 'username', 'all_hashtags', 'followers_count', 'location'])

        #for each tweet matching our hashtags, write relevant info to the spreadsheet
        for tweet in tweepy.Cursor(api.search, q=hashtag_phrase+ ' -filter:retweets', \
                                   lang="en", tweet_mode='extended').items(1000):
            w.writerow([tweet.created_at, tweet.full_text.replace('\n', ' ').encode('utf-8'), tweet.user.screen_name.encode('utf-8'),
                        [e['text'] for e in tweet._json['entities']['hashtags']],
                        tweet.user.followers_count, tweet.user.location.encode('utf-8')])

consumer_key = input('consumer_key')
consumer_secret = input('consumer_secret')
access_token = input('access_token')
access_token_secret = input('access_token_secret')
hashtag_phrase = input('Hashtag Phrase ')

if __name__ == '__main__':
    search_for_hashtags(consumer_key, consumer_secret, access_token, access_token_secret, hashtag_phrase)
```

- **Data Source:**

- ~2000 Twitter postings from April 14, 2020
- Each tweet contains at least one of the following hashtags: Coronavirus, Covid19, Asian, Asians, Kungflu, Chinesevirus

- Columns of CSV file:

- Timestamp
- Tweet_text
- Username
- All_hashtags
- Followers_count
- Location

```

VADER Lexicon

The tool we are using to measure the sentiment is the Valence Aware Dictionary and sEntiment Reasoner(VADER) lexicon. The tool is specifically attuned to sentiment expressed via social media, making it a perfect tool for tweets.

The creators of VADER describe the tool's assessment of polarity, or "compound score," in the following way:

"The compound score is computed by summing the valence scores of each word in the lexicon, adjusted according to the rules, and then normalized to be between -1 (most extreme negative) and +1 (most extreme positive). This is the most useful metric if you want a single unidimensional measure of sentiment for a given sentence. Calling it a 'normalized, weighted composite score' is accurate."

VADER doesn't "read" sentences, but works by parsing sentences into words assigning a preset generalized score from their testing sets to each word separately.

Computing Polarity

To compute the polarity with Vader:

1. Split each cleaned tweets into a list of words
2. Reformat each list into a tidy_format
3. Identify polarity score of each word using Vader's txt file of polarity scores
4. Compute compound score

Replaced Vader's SentimentIntensityAnalyzer method with our own algorithm

- Want non-normalized polarity scores
- Normalized polarity scores may cause problems when analyzing multiple datasets

```
tidy_format = (tweets_df["clean_text"].str.split(expand=True).stack()
               .reset_index(level=1).rename(columns={'level_1': 'num', 0: 'word'}))
tweets_df['polarity'] = tidy_format.merge(vader_lex, how='left', left_on='word', right_index=True)
               .reset_index().loc[:, ['index', 'polarity']].groupby('index').sum().fillna(0)
```

Mapping Mean Polarity Scores to Location

In order to create a map such as the following, we must tackle faulty Twitter data

Mapping Mean Polarity Scores to Location

b' '
b' '
b'California, USA'
b' '
b'Out of The Closet'
b'Dayton, OH'
b' '
b'Singapore'
b' '
b'Japan'

b'USA and Canada'
b'Mobile, AL'
b'Worldwide'
b'Worldwide'
b'USA'
b'Chicago, IL'
b' '
b'Houston, TX'
b'Kansas City, MO'

Problems with Location Data:

1. Many users choose not to include their location
2. Many invalid locations such as “Out of The Closet”
3. If exists, locations are written in various formats (not standardized)

Solution Attempt To Handle Faulty Location Data

Recognized that most valid locations contain at least one of the following:

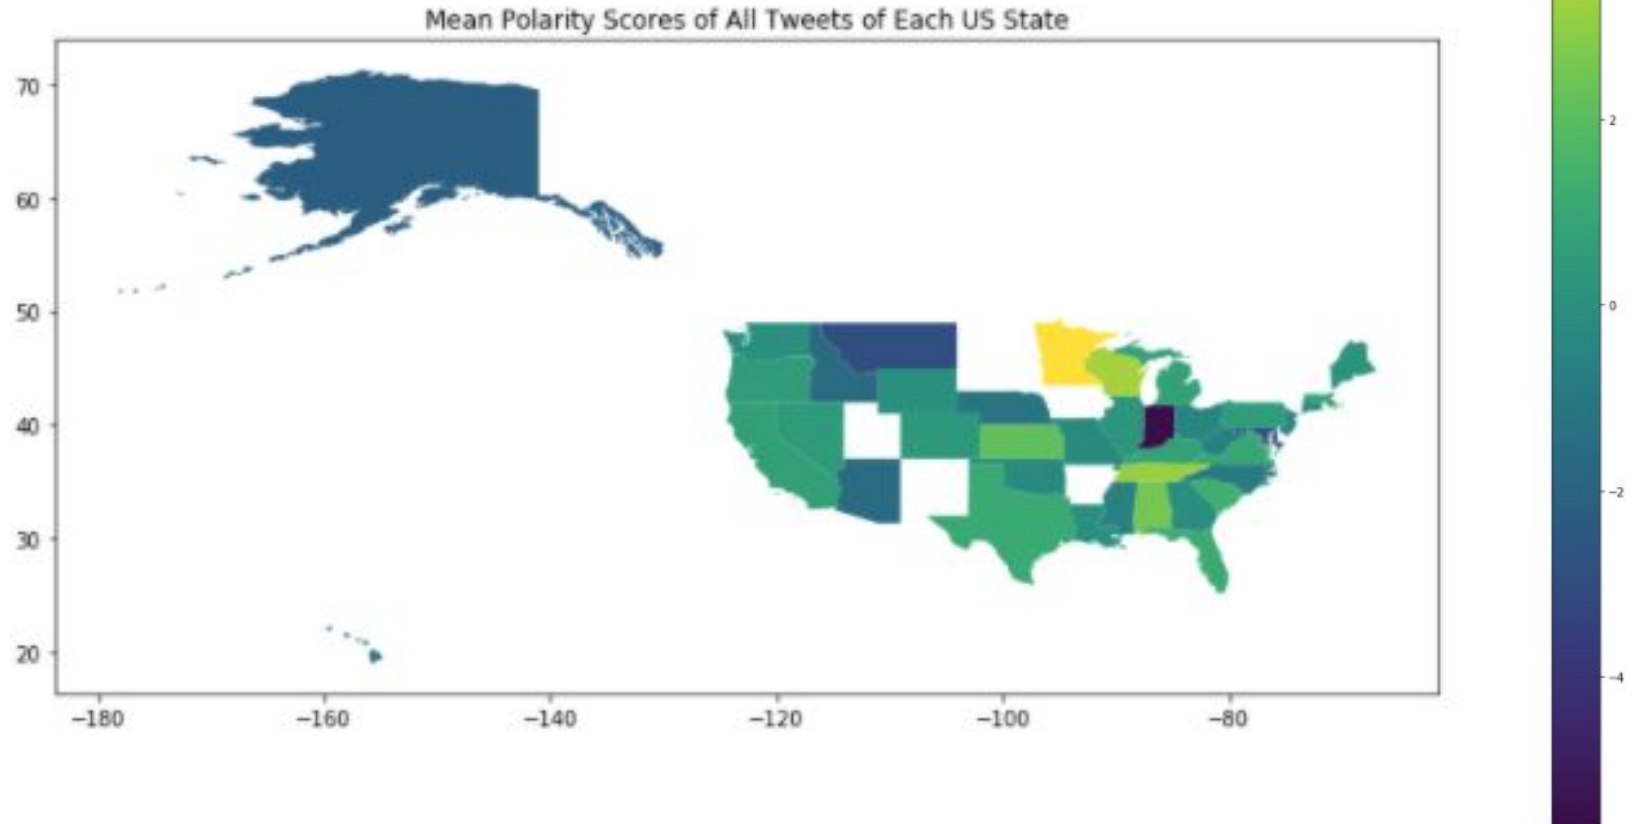

- State names
- State abbreviations
- Major city names
- Any of the above, but either all lowercase or one uppercase

Solution:

- Import and combine multiple databases to obtain all existing state names and abbreviations as well as major cities in the US
- Parse through each given location and identify at least one of the keywords given above derived from the combined imported and modified databases

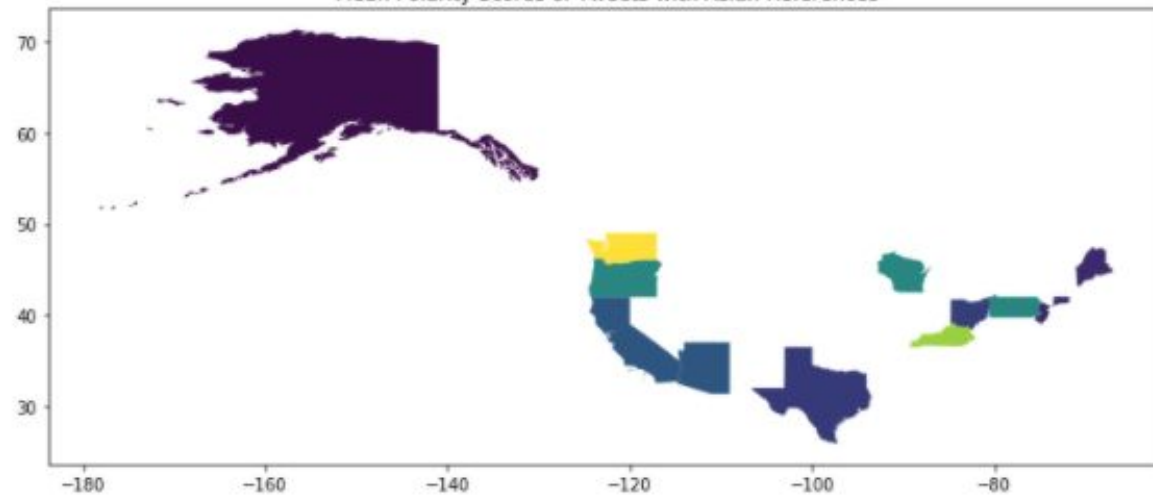

Mapping Mean Polarity Scores to Location

Mapping Number of Coronavirus Cases to Location

Mean Polarity Scores of Tweets with Asian References

Number of Coronavirus Cases on April 14, 2020

Computing Correlation Coefficients

- **cases** denotes the number of Coronavirus cases in each state
- **mean_polarity** denotes the mean polarity score of tweets with Asian references of each US state (if available)

```
1 # Computing Pearson's Correlation: (To understand strength of linear relationship between the two datasets)
2 p_corr, _ = pearsonr(cases, mean_polarity)
3 corr
```

-0.226606970260943

```
1 # Computing Spearman's Correlation: (To investigate if there may be a nonlinear relationship)
2 s_corr, _ = spearmanr(cases, mean_polarity)
3 s_corr
```

0.02209978480439319

Computing Correlation Coefficients

Pearson's Correlation Coefficient:

- Used to understand the strength of linear relationship between the two datasets
- More fitting to our datasets

Spearman's Correlation Coefficient:

- Used to investigate whether there may actually be a nonlinear relationship
- Less fitting to our datasets

Focusing on the Specifics

Examining tweets using certain hashtags:
#asian & #asians, #kungflu & #chinesevirus

The Data

Data Source:

- Tweets from April 14, 2020
- Each tweet contains at least one of the following hashtags: Asian, Asians, Kungflu, Chinesevirus

Columns of CSV file:

- Timestamp
- Tweet_text
- Username
- All_hashtags
- Followers_count
- Location

Most negative tweets regarding #kungflu and #chinesevirus:

after feeding them with rats and bats, china is now feeding it's oppressed citizens with lies that africans are the cause of the #chinesevirus #chinesevirus19 or the #kungflu, evicting africans like the dogs they eat,,,we shall deal with your racist a ss #chinamustexplain"

@davidlipson it's another horrible dirty disease that originated from china, the country whose image will suffer the most. n obody believes china doesn't have the most deaths. #chinesevirus #kungflu"

@amnestyusa when did you go from "fighting the bad guys" to "defending and protecting the bad guys"??? \xf0\x9f\xa4\xa8 #chinesevirus #chinesewuhanvirus #chineseviruscorona #chinese coronavirus #kungflu #flumanchu #hongkongfluey #chinese flu #wuflu

and #china calls everyone racist who questions their mishandling of #chinesevirus #wuflu #kungflu #racist

time of plague 4 "govt non-essential workers to stay at home" somebody please explain to me what the hell is a "govt non-essential worker" & why the hell are we paying them our tax dollars if they're non-essential??? #chinesevirus #kungflu #chicomavirus #wuhflu #covid\xe3\x83\xbc19

Challenges

- Facebook API is too difficult to utilize
- Twitter API is restrictive on number of tweets you can extract.
- Twitter also prevents you from collecting tweets over a long period of time
- COVID-19 disrupted workflow, preventing us from meeting up and coding together

Conclusion

The Future

A decorative pattern at the bottom of the slide consisting of numerous vertical bars of varying heights and shades of blue, creating a stylized, modern look.

Thank you!
